Astonishing Healing of a Thrombosis within 12 days using SANUM Remedies

A Report from Practice

by Brigitte Winkelmann, Naturopath
On 17 March 2004, a 50-year-old, very critical academic paid his first visit to my practice, complaining of major problems and bringing with him the allopathic diagnosis: thrombosis in the right calf. The calf felt hard, and he was suffering severe pain in the thigh area, extending up into the lumbar spine. The symptoms had appeared in February 2004. He had consulted a prestigious clinic in Munich and two neurologists. Nuclear magnetic resonance tomography had shown the development of an increasing disc prolapse. The patient was awaiting surgery for both the thrombosis and the disc prolapse. The medicines he was taking were Valoron 100, Vioxx 50, Ultralan 5 mg., Ranitidine and Marcumar.

As the operations were due to take place in the near future, I did not have much time for a SANUM treatment. I told the patient of my intention to unburden his metabolism, to de-acidify him and to treat his vessels with MUCOKEHL. The focus of my treatment was to be a thoroughgoing revision of his diet to food of purely vegetable origin, excluding all animal protein. At the same time, he was to drink alkaline vegetable broth, as well as teas for the kidneys and liver. For de-acidification I proposed the intake of alkaline salts (ALKALAN) and at the same time alkaline baths of arms and feet, using the same salt. For the same purpose, I recommended him to take weak organic acids in the form of harmonic potencies (potency accords) in the shape of CITROKEHL and SANUVIS. I prescribed MUCOKEHL 5X to be massaged in locally in very small doses.

The patient commenced treatment on 19. March, 2004 with the following prescription:

- Nemabas tablets, 2 twice a day after meals.
- MUCOKEHL 5X, 1-2 drops once a day, to be dabbed on carefully over the affected vessel or rubbed in.
- SANUVIS, 2 tablets once a day, to be sucked in the course of the morning.
- CITROKEHL, ½ tablet to be sucked in the evening.
- Polilevo drinking bottle, one once a day.
- Steiner’s Urinary Tea, 3-4 cups daily.

At the same time, the diet was thoroughly revised, although the consumption of vegetable broth and bitter tea for detoxification of the liver proved just as difficult to negotiate as the taking of salt baths.

On 31 March 2004 (i.e. 12 days into the treatment), the patient reported to the clinic in Munich to fix the date for his operation. To the great astonishment of the head doctor and the Professor, whom he called in, the ultrasound showed no remaining sign of the thrombosis. A nice side-effect to be recorded was that the disc prolapse, whilst still present, was no longer causing pain, which meant that this operation was also superfluous.

On 7 May 2004, I had a further visit from the patient. He was mightily pleased at the result of the treatment, which had enabled him to dispense with both operations and had brought about such an improvement; all that remained was some numbness in three toes on the right foot.

I too was extremely pleased at the rapid success of this treatment.
